DESCRIPTION

The HEF4508B is a dual 4-bit latch, which consists of two identical independent 4-bit latches with separate strobe (ST), master reset (MR), output-enable input (\overline{EO}) and 3-state outputs (O).

With the ST input in the HIGH state, the data on the D inputs appear at the corresponding outputs provided \overline{EO} is LOW. Changing the ST input to the LOW state locks the

data into the latch. A HIGH on the reset line forces the outputs to a LOW level regardless of the state of the ST input. The 3-state outputs are controlled by the output-enable input. A HIGH on $\overline{\text{EO}}$ causes the outputs to assume a high impedance OFF-state regardless of other input conditions. This allows the outputs to interface directly with bus orientated systems. When $\overline{\text{EO}}$ is LOW the contents of the latches are available at the outputs.

| MR _A , MR _B | master reset inputs |
| $\overline{EO}_A, \overline{EO}_B$ | output enable inputs |
| O_{0A} to O_{3A},O_{0B} to O_{3B} | 3-state outputs |

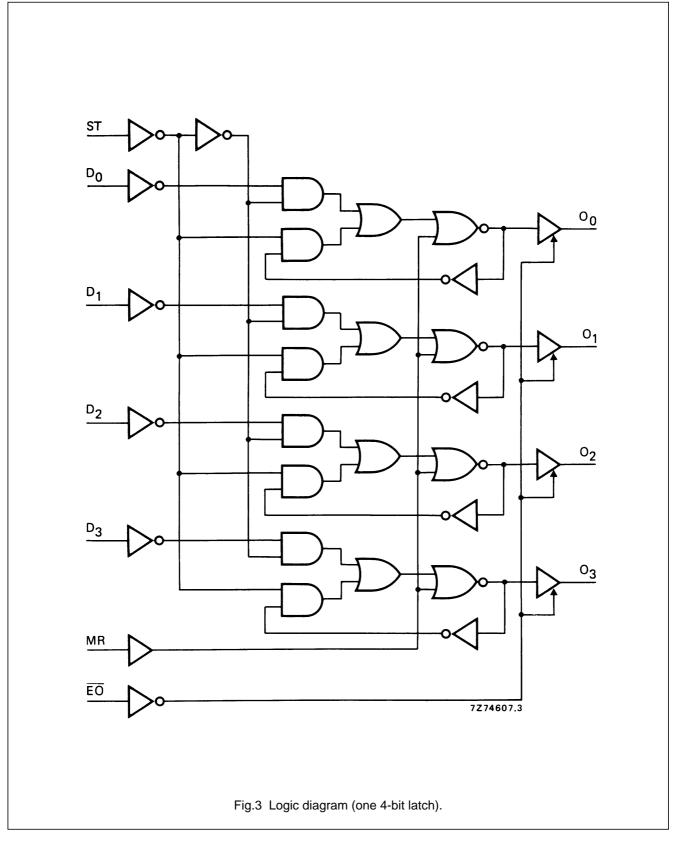

FUNCTION TABLE

| | INPUTS | | | | | |
|----|--------|----|----------------|---------|--|--|
| MR | ST | EO | D _n | On | | |
| L | Н | L | Н | Н | | |
| L | н | L | L | L | | |
| L | L | L | X | latched | | |
| Н | Х | L | X | L | | |
| Х | Х | н | X | Z | | |

Notes

- 1. H = HIGH state (the more positive voltage)
 - L = LOW state (the less positive voltage)
 - X = state is immaterial
 - Z = high impedance OFF state
